

Destination IP Addresses (if required by firewall)

Last Modified on 06/01/2018 12:51 pm EDT

In some cases, a firewall may require a destination IP address. Below lists IP addresses that work in this situation (Port 443):

- 54.72.5.235
- 54.171.0.176

For large (enterprise) clinics **with reliable DNS clients**, it is recommended to open a DNS Name instead of using the listed IP addresses above because it is easier to scale and maintain. An example of this situation would be:

- Domain: receiving.trice.io
- Port: 4443

Notes:

- Current customers do not have to change their settings - previous configurations still work
- In order for the auto-update feature to work, the firewall must be opened properly
 - downloads.tricefy.com
 - Port 443
